

(maximum of 10 minutes)

Demo: Each group need to record a 10 minutes project demonstration video (not all team members are required to present) and send this video to the instructor and TAs. If the video is too large to serve as an email attachment, a Google drive share or a private YouTube link is preferred. In addition, the source code should be shared to the TAs.

== ~1000

Hello and welcome to our video demonstration. In this video we will showcase our prototype, go through our code, and discuss our next step

Here's a locally hosted demo of our project frontend. As you can see, we have a user login feature that validates different user roles. Eventually this will redirect to CWRU Single Sign On once this project is hosted and approved through U[Tech]. As you can see, any guest is able to browse the existing catalog. Right now this table is populated by real books the LGBT Center has available. If I switch to an employee level user, you can see they have access to a table where they can edit the catalog. Finally, the admin level user has their own table where they can add and remove employees/admins. This frontend is all built off React + Vite.

Taking a look at the database schema, we can see the different tables our app will use to keep track of all the information for the frontend. The book table along with author and tags tables stores all the relevant intrinsic data about items in the catalog. The users table is used to keep track of all the active users of our app including patrons, employees, and administrators and the loans of said users are stored in the loan table.

Here's all the code for our backend API:

This is go lang software written to be an interface between our database schema and the frontend that handles logic for more complex features. It does this by constructing an API server that can perform functions to dynamically call database queries and return the desired information to endpoints on the frontend.

Overall, we've made a solid start but there are still areas that we need to work on before this project can be called done: firstly, unifying the frontend and backend so they work efficiently together and the user is able to access all the right information and relevant features. Secondly, finishing our discussion with U[Tech] about server hosting is a necessary step that will streamline future development progress. Improving the UI and preparing for integration and deployment is our next goal.

We hope that this application can be used to improve the workflow of the LGBT center employees and improve the experience for its guests.
